

♦ **Yarnia** · *the opposite of a screen*

THE CUSTOMER · THE PROBLEM

It's 8pm. The kid won't settle.
The parent reaches for the iPad **they'll**
regret.

- ♦ **Who:** a parent of a 3–7 year old. Not "families broadly," but one person you can picture, who exists **every single night**.
- ♦ **Today they choose between two bad options:** hand over a glowing screen (and the guilt), or fight bedtime alone.
- ♦ The one ritual parents most want to protect is the one most colonized by screens.

Yarnia: a **screen-off** voice that knows your child.

- ✦ Open it → the screen goes dark → a warm voice greets your child **by name**.
- ✦ A quick, low-key co-creation ("an owl or a dragon tonight?"), then it narrates a calm, personalized story to sleep.
- ✦ Every story is saved. Send tonight's to grandma with one tap.

The moment that wins

"Another dragon story like last time? I'll keep the thunder out."

It opens already knowing the child. That single line is the whole pitch, and the one thing a recorded catalog can't say.

WHY NOW

This is only possible in 2026.

Expressive voice

Real-time, emotional TTS (ElevenLabs) finally sounds like a person telling a story, not a robot reading one. A year ago this broke the spell.

Cheap generation

A fresh, safe, personalized story per child per night went from a research budget to fractions of a cent.

The anti-attention turn

Parents in 2026 actively want **less** screen, not more. The cultural moment finally rewards a product that turns the screen off.

MARKET · COMPETITION

Sleep apps play the same recording for every kid. **We don't.**

Moshi · Calm Kids

Pre-recorded catalog. Same story for every child. No memory.

Yoto · Toniebox

Fixed physical cards. Lovely hardware, frozen content.

Yarnia

Generative + per-child memory. The kid is the hero, and it remembers them. A fundamentally different product shape.

~€8/mo

PRICE PARENTS SAY
WITHOUT HESITATION

€8/mo, and the behavior is **already real**.

- ♦ **Model:** €8/mo subscription. Calm is €8, Spotify €10. A price below the "do I need this" threshold.
- ♦ **Trust as a feature:** every story runs through age + safety constraints and avoids the exact things that scare your kid, because it remembers them.
- ♦ **Live signup page** at yarnia.quest, built to share into parent communities.

Non-copyable evidence

Before Yarnia existed, our founder ran the exact ritual by hand: a recurring ChatGPT bedtime saga for his kids, "**Finn & Ella**."

Jan 2025 first story: Finn & Ella go to Kita

Jan-Feb the golden key, the secret in the glass...

Jun 2025 still returning: the cherry tree, the horses Luma & Rocco

10+ stories over 6 months, same world, growing memory. The demand isn't a guess. We **lived it**.

GO - T O - M A R K E T

The story sells the **next** parent.

1 • The share loop

Every story ends with "send tonight's story to grandma." Grandma hears it → a new parent lands at the top of the funnel. Distribution is built into the product, not bolted on.

2 • Where parents already gather

Parent communities (r/Parenting, local Hamburg/DE groups) and preschool / daycare partnerships. Naming a real channel, not "we'll do ads."

The moat compounds: **the longer a family uses Yarnia, the more it knows their child, and the more starting over costs.**

TEAM · CONTACT

Two engineers. One **lives the problem.**

Burhan

Father of two daughters. Bedtime is the ritual he refuses to outsource to a screen, and the one he already hand-built for years. Founder-market fit, and he builds.

Cansin

Engineering: voice, memory, and the backend that makes the story feel alive in real time.

Our open question: **do parents trust an AI to tell their kid a story?** So we built safety in from day one.
